Email Setup for Windows Live Mail

The settings are as follows:

Incoming mail server type   **POP3**

Incoming Server   **mail.harewaves.net** Port 995   **SSL ON**

Email address   user@harewaves.net   this is your email address

Password   Your email password

Outgoing Server   **mail.harewaves.net** Port 2525   **SSL OFF**

Click - log in using clear text authentication

Click - My server requires authentication

For initial setup continue reading:

Windows Live Mail will try to auto configure the settings, but it will miss a few things.   This will walk you through the procedure.

Click the file tab, and click the +Mail button - depending on your version, you may have to look around a bit to find where to add and modify (properties) your email account.

Type in your email address and password in the appropriate fields.   Add a display name (this can be what ever you want).   For now leave empty the check box to Manually configure server settings.

Click Next   bottom right...

The Configure Server Settings Window.

Incoming Server Information

Server Type **POP**

Server address **mail.harewaves.net**

Port **995**   check - Requires authentication

Authenticate using Clear text

Login username   **enter your email address**

Outgoing server information

Server address   **mail.harewaves.net**

Port **2525**

Check Requires authentication

Click Finish

One last thing:

Open the email properties window and click the advanced tab. Add a check to "Remove from the server after **5** days", and add a check to "Remove from the server when deleted from deleted items". We recommend these delete settings so you don't have mail filling up your mail box on our server, which can stop you from receiving mail. You may need to adjust this "Remove from the server" time to suit your needs.

That should do it. If you have any trouble, verify each setting and your email password.   Everything needs to be correct.
